

Onboarding Calibration Engine

During the onboarding we want to have a test prompt given and the user attempt the various prompts at range levels of difficulty in word choice, tone recommendations, pacing, and emotions.

Then the calibration should give a score that we can then know to use that type of language style/pattern during the actual calls.

This will allow for the user to feel more comfortable when speaking over the calls, because the word choice of recommended prompts will be more in alignment with what feels natural.

```

    "final_score": 87,
    "recommended_tier": "empathy-high-pacing"
  },
  "calibration_hash": "{{sha256}}"
}
```

During onboarding, the engine runs the 20-question test, records scores, and sets **recommended_tier** for live call prompts.

The calibration engine will output a final score after all test prompts.

Show **only** the **final calibration summary** to users after onboarding, **not every prompt**.

Pure-JSON template that you (or a script) can hydrate with a deterministic seed. Because JSON itself cannot execute logic, the generator is expressed as a **JSON Logic** object plus a one-liner of JavaScript to evaluate it. The JSON is 100 % portable—you can store it, transmit it, or feed it to any JSON-Logic runtime.
